7. NOTES.md — Eight Answers

1. For three endpoints, give method, success status and the most important response header, with reason.
2. Identify safe and idempotent endpoints; identify the neither-safe-nor-idempotent operation and explain its retry protection.
3. Show one ETag, the request returning 304, and the write returning 412; explain what each saves/prevents.
4. Give exact requests for one 422 and one 400 and explain domain refusal versus malformed input.
5. Explain browser-side CORS blocking and the Access-Control-Allow-Origin response header.
6. Give one cacheable read and one no-store response and explain why.
7. Explain when a complex search might use POST instead of GET and what properties are lost by switching.
8. Explain Location on 201 as the new resource target and on 3xx as the redirect target.
