1. What You Need to Build

- Update every API endpoint so its HTTP method matches the action.
- Use POST sub-resources for non-CRUD actions such as execute, cancel and reset.
- Document safe and idempotent behavior for every endpoint.
- Use GET query parameters for filtering, sorting and pagination.
- Implement OPTIONS + Allow for at least one resource.
- Add Content-Type, Accept handling and 406 for unsupported response types.
- Use the required status codes and Location header behavior.
- Protect required endpoints with Authorization: Bearer <token>.
- Add Cache-Control and ETag to a single-item GET.
- Implement 304 If-None-Match and 412 If-Match behavior.
- Implement Idempotency-Key for risky POST operations.
- Add rate-limit headers and 429 + Retry-After.
- Add CORS and OPTIONS preflight support.
- Add nosniff and HSTS security headers.
- Capture curl -v evidence and write NOTES.md.
- Update openapi.yaml and tests.
