5. Part C — Caching & Safe Retries

C1 — Conditional GET

```
GET /api/executions/101
Response: 200 OK
ETag: "abc123"
Cache-Control: max-age=60

GET /api/executions/101
If-None-Match: "abc123"
```

If the ETag still matches, return 304 Not Modified with no body.

C2 — Conditional write

```
PUT /api/executions/101
If-Match: "abc123"
```

If the current ETag no longer matches, return 412 Precondition Failed instead of overwriting another update.

C3 — Idempotency-Key

For POST execute, accept Idempotency-Key. Repeating the same key must return the original result without duplicate work.

C4 — Safe-retry plan

Operation	Mechanism	Why
POST execute	Idempotency-Key	Prevents duplicate execution on retry.
GET single item	If-None-Match	Avoids transferring unchanged data.
PUT/PATCH update	If-Match	Prevents stale clients overwriting newer data.
DELETE	Idempotent semantics	Repeated delete does not restore/create the resource.
